Network traffic dynamics and multi-horizon attack forecasting

Three preselected synthetic validation episodes | H5 / H10 / H15 forecasts | Sequence and competing-risk architectures

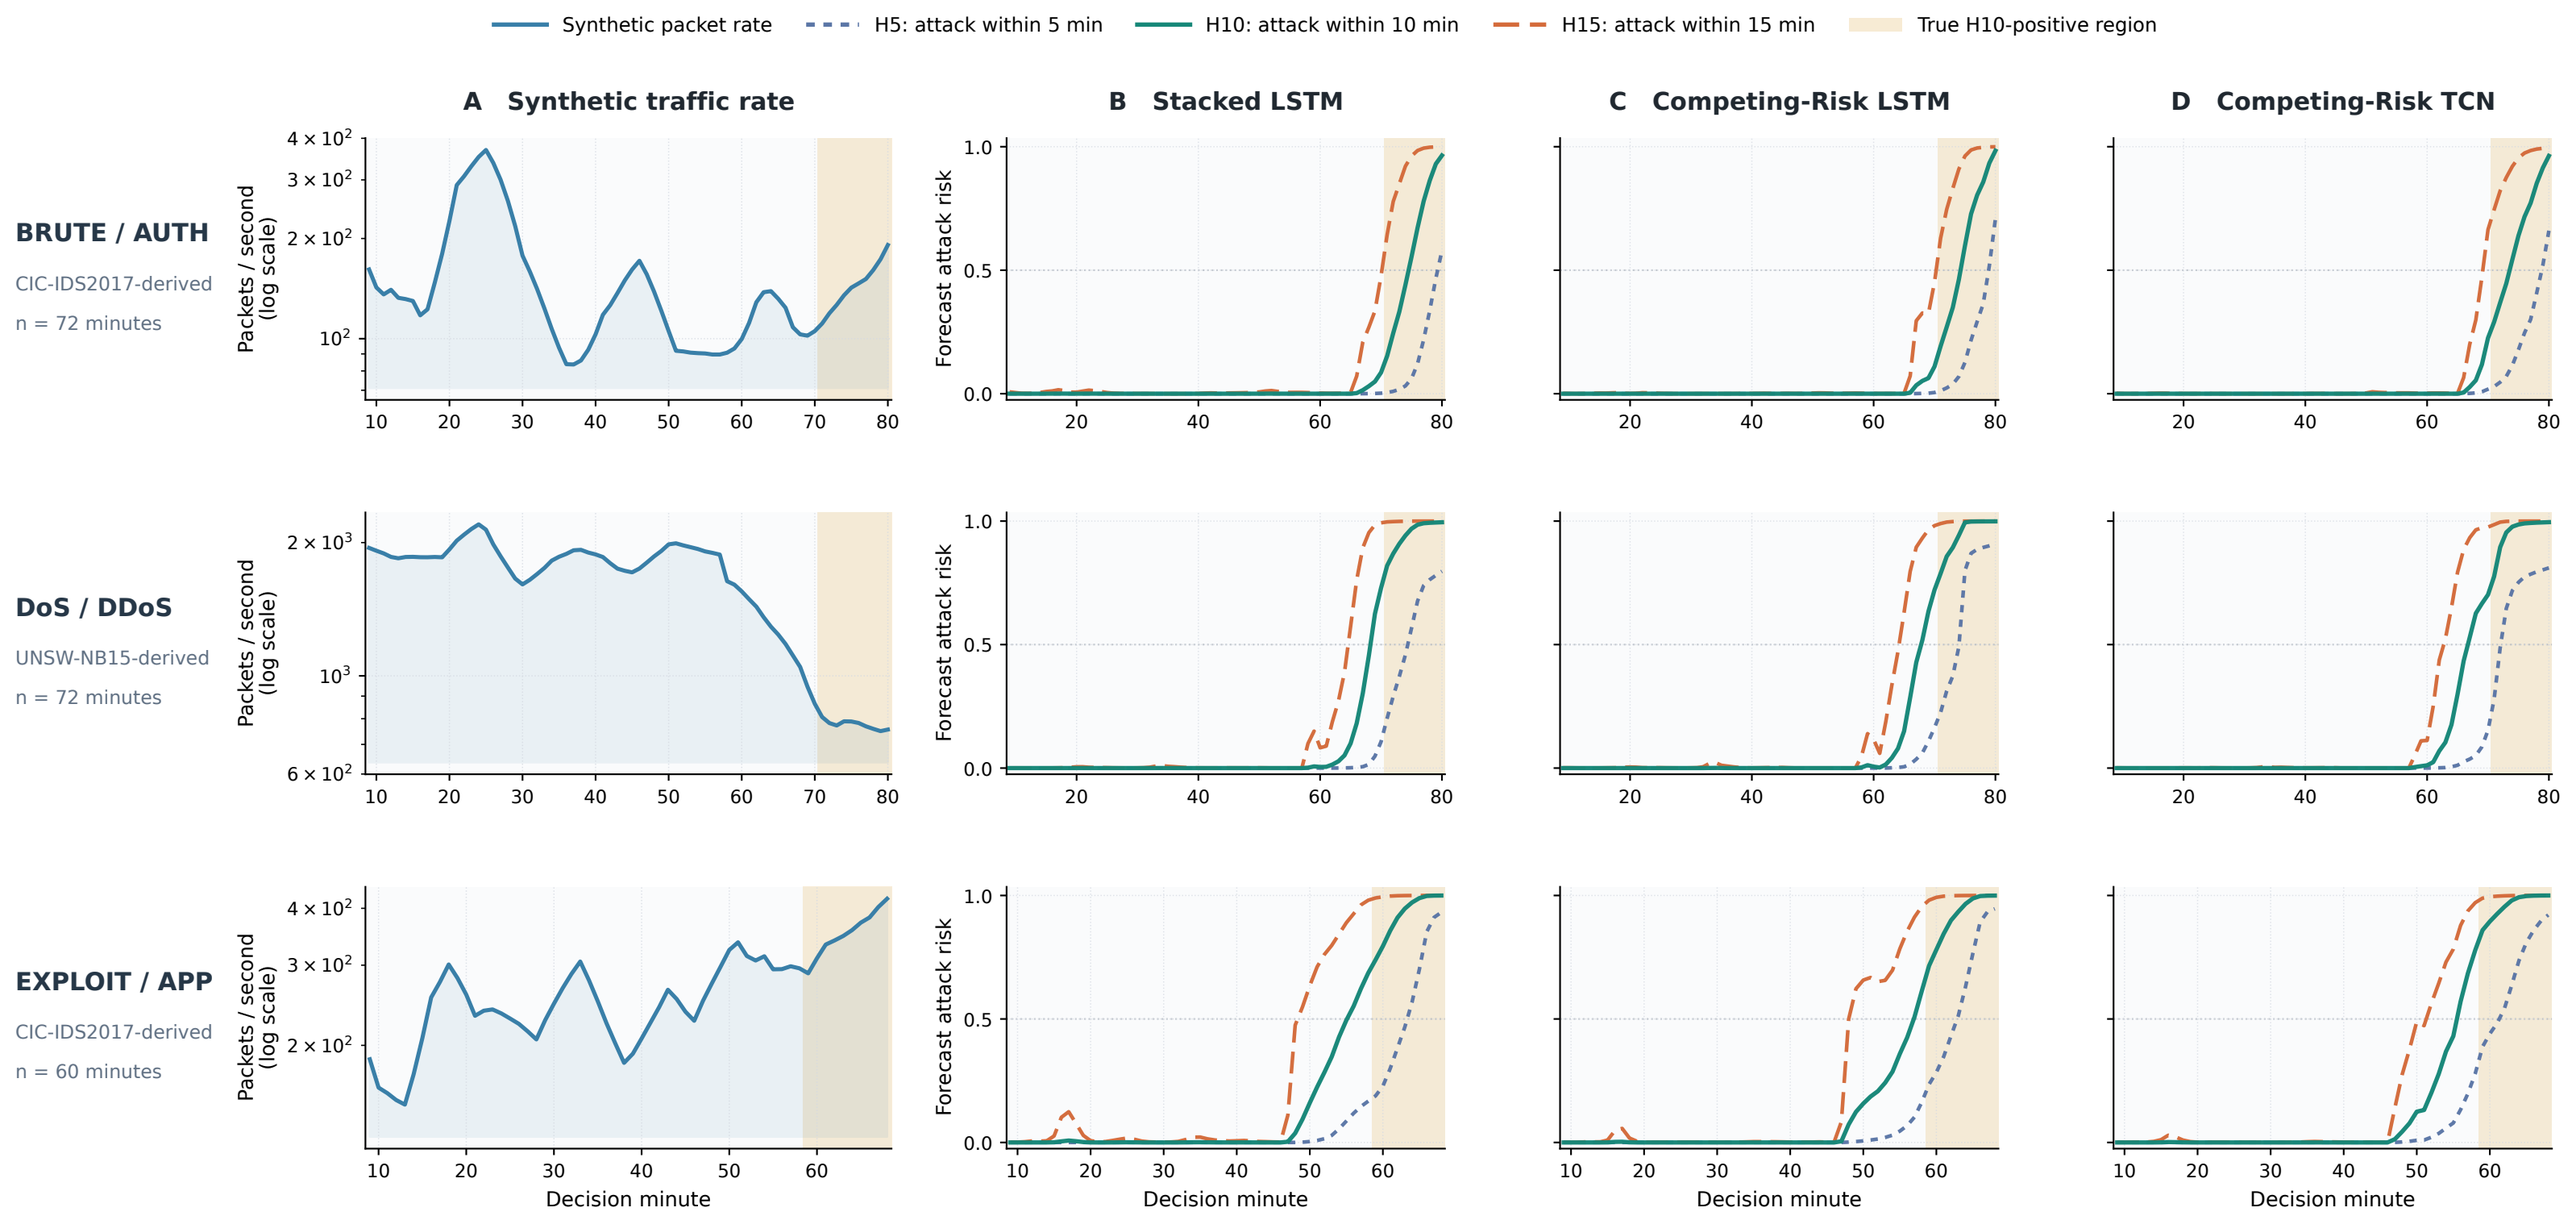

Figure 1. Synthetic packet-rate trajectories and saved future-attack probability forecasts for three preselected validation episodes.
Gold shading identifies decision minutes with a positive H10 forecast target; it does not identify exact attack onset. The dotted 0.5 risk line is illustrative.
All curves are from aligned saved validation predictions. Examples are illustrative, not aggregate model performance or evidence of real-network deployment.
